

2019 SUMMER CHALLENGE: ALONZO!

Written by [The team](#) · 2019-06-18 · in [Challenges](#)

The Synacktiv summer challenge is back!

Dana has just finished [a nice brain teaser](#) for his friend Alonzo. It is a Linux executable that accepts a single argument, and displays a string. Can you craft an input that makes the program print Alonzo!?

Once you have found a valid input, validate the challenge by sending your solution to hacktheplanet@synacktiv.com.

Contestants will be ranked by time of submission. The prizes are:

1. The winner gets a [ChipWhisperer Lite 32-bit Basic Board](#)
2. The second to answer gets a [HummingBoard Edge](#)
3. And finally, the third wins a [Diva IOT board](#)

Happy reversing!

The Synacktiv Team

P.S.: Of course, it might be possible to exploit a bug in the validation logic and take a shortcut here. Even though they will not qualify for a prize, do not hesitate sending us these solutions!
